### Syllabus for B.Tech Admission Batch 2022

**Subject Name: Design & Analysis of Algorithm      Credit: 3      Lecture Hours: 36**  
**Subject Code: PCCCS404**

Module number	Topic	Sub-topics	Mapping with Industry and International Academia	Lecture Hours	Corresponding Lab Assignment
1	Introduction to Algorithms	Characteristics of algorithm. Analysis of algorithm: Asymptotic analysis of complexity bounds – best, average and worst-case behaviour; Performance measurements of Algorithm, Time and space trade-offs, Analysis of recursive algorithms through recurrence relations: Substitution method,	<b>International Academia:</b> (MIT Open Courseware): Overview, Interval Scheduling, Complexity: Approximation Algorithms, Fixed-parameter Algorithms, Cache-oblivious Algorithms: Medians & Matrices, Searching & Sorting <a href="https://ocw.mit.edu/courses/6-046j-design-and-analysis-of-algorithms-spring-2015/pages/lecture-notes/">https://ocw.mit.edu/courses/6-046j-design-and-analysis-of-algorithms-spring-2015/pages/lecture-notes/</a>  <b>AICTE-prescribed syllabus:</b> <a href="https://www.aicte-india.org/sites/default/files/Mod">https://www.aicte-india.org/sites/default/files/Mod</a>	8	1. Given a sorted array and a number X, search two elements of the array such that their sum is X. Expected time complexity is $O(n)$ .  2. Given a sorted array and a number x, write a function that counts the occurrences of x in the array. Expected time complexity is $O(\log n)$ .  3. Median of two sorted arrays: There are 2 sorted arrays A and B; each of size n. Write an algorithm to find the median of the array obtained after merging the above 2 arrays (i.e. array of length 2n). The complexity should be $O(\log(n))$ .

		<p>Recursion tree method and Masters' theorem.</p> <p><b>Industry Mapping:</b> As per competitive coding standard of various industry. Also refer to laboratory exercises.</p>			<p>4. Given an array of digits, sort them with time complexity <math>O(n)</math>.</p>
2	Fundamental Algorithmic Strategies	<p>Brute-Force, Divide and Conquer, Greedy, Dynamic Programming, Branch-and-Bound and Backtracking methodologies for the design of algorithms; Illustrations of these techniques for Problem-Solving, Bin Packing, Knapsack TSP. Heuristics – characteristics and their application domains.</p>	<p><b>International Academia:</b> (MIT Open Courseware): Divide &amp; Conquer: Convex Hull, Median Finding, FFT, Van Emde Boas Trees, Randomization: Matrix Multiply, Quicksort, Dynamic Programming: All-pairs Shortest Paths, Greedy Algorithms: Minimum Spanning Tree <a href="https://ocw.mit.edu/courses/6-046j-design-and-analysis-of-algorithms-spring-2015/pages/lecture-notes/">https://ocw.mit.edu/courses/6-046j-design-and-analysis-of-algorithms-spring-2015/pages/lecture-notes/</a></p> <p><b>AICTE-prescribed syllabus:</b> <a href="https://www.aicte-india.org/sites/default/files/Model_Curriculum/AICTE%20-%20UG%20CSE.pdf">https://www.aicte-india.org/sites/default/files/Model_Curriculum/AICTE%20-%20UG%20CSE.pdf</a></p> <p><b>Industry Mapping:</b></p>	14	<p>1. Implement Binary Search using Divide and Conquer.</p> <p>2. Apply Binary Search on 2D <math>N \times M</math> array (A) having numbers stored in non-decreasing order under row-major scanning.</p> <p>3. A Bitonic Sequence is a sequence of numbers which is first strictly increasing then after a point strictly decreasing. A Bitonic Point is a point in the bitonic sequence before which elements are strictly increasing and after which elements are strictly decreasing. Find bitonic points in a bitonic sequence.</p> <p>4. Apply Merge Sort to count inversion pairs in an array. Two elements <math>a[i]</math> and <math>a[j]</math> form an inversion pair if <math>a[i] &gt; a[j]</math> and <math>i &lt; j</math>. Example: The sequence 2, 4, 1, 3, 5 has three inversions (2, 1), (4, 1), (4, 3).</p> <p>5. Implement a greedy algorithm to solve the fractional knapsack problem.</p>

			<p>As per competitive coding standard of various industry. Also refer to laboratory exercises.</p>	<p>6. Find the second largest and second smallest number simultaneously in an array using Divide &amp; Conquer Principle.</p> <p>7. Find neighbors of the median element in an array using the partitioning strategy of the Quick-Sorting method.</p> <p>8. Given an array <math>p[]</math> which represents the chain of matrices such that the <math>i</math>-th matrix <math>A_i</math> is of dimension <math>p[i-1] \times p[i]</math>. We need to write a function that should return the optimal parenthesizing expression resulting in a minimum multiplication cost to multiply the chain.</p> <p>9. Given weights and values of <math>n</math> items, put these items in a knapsack of capacity <math>W</math> to get the maximum total value in the knapsack. You cannot break an item, either pick the item, or don't pick it.</p> <p>10. Implement the greedy algorithm to solve the problem of the Job Sequencing with deadlines.</p> <p>11. Implement a greedy algorithm for finding the single-source shortest paths. Suggest an algorithm if the given graph contains negative weights and non-negative weight cycle and implement it.</p>
--	--	--	--	--

					<p>12. Apply Strassen's Matrix Multiplication strategy for odd dimensional square matrices.</p> <p>13. Given a cost 2D-matrix and a position (m, n), write a function that returns the minimum cost-path to reach (m, n) from (0, 0).</p> <p>14. Given a value V and an infinite supply of coins of m-denominations <math>\{C_1=1 &lt; C_2 &lt; C_3 &lt; \dots &lt; C_m\}</math>, we want to make change for Rs. V. Apply DP strategy to find out the minimum number of coins to make the change?</p> <p>15. Implement all pairs of the Shortest path algorithms for a graph using Floyd Warshall's strategy.</p>
3	Graph and Tree Algorithms	Traversal algorithms: Depth First Search (DFS) and Breadth First Search (BFS); Shortest path algorithms, Transitive closure, Minimum Spanning Tree, Topological sorting, Network Flow Algorithm.	<p><b>International Academia:</b> (MIT Open Courseware): Minimum Spanning Tree, Synchronous Distributed Algorithms: Symmetry-breaking. Shortest-paths Spanning Trees, Baseball Elimination Notes <a href="https://ocw.mit.edu/courses/6-046j-design-and-analysis-of-algorithms-spring-2015/pages/lecture-notes/">https://ocw.mit.edu/courses/6-046j-design-and-analysis-of-algorithms-spring-2015/pages/lecture-notes/</a></p> <p><b>AICTE-prescribed syllabus:</b></p>	8	<p>1. Given a set of non-negative integers, and a value sum, determine if there is a subset of the given set with sum equal to given sum.</p> <p>2. Implement DP strategy to solve the Traveling Salesman Problem (TSP).</p> <p>3. Students need to develop a software or tool using any language for Plagiarism Checker. The primary objective of this project is that they have to implement a data structure concept and algorithm and show us how they implement it.</p>

			<a href="https://www.aicte-india.org/sites/default/files/Model_Curriculum/AICTE%20-%20UG%20CSE.pdf">https://www.aicte-india.org/sites/default/files/Model_Curriculum/AICTE%20-%20UG%20CSE.pdf</a>  <b>Industry Mapping:</b> As per competitive coding standard of various industry. Also refer to laboratory exercises.		4. Professor Sarkar thinks he has discovered a remarkable property of binary search trees. Suppose that the search for key $k$ in a binary search tree ends up in a leaf. Consider three sets: $A$ , the keys to the left of the search path; $B$ , the keys on the search path; and $C$ , the keys to the right of the search path. Professor Bunyan claims that any three keys $a \in A$ , $b \in B$ , and $c \in C$ must satisfy $a \leq b \leq c$ . Give a smallest possible counterexample to the professor's claim.
4	Tractable and Intractable Problems	Computability of Algorithms, Computability classes – $P$ , $NP$ , $NP$ -complete and $NP$ -hard. Cook's theorem, Standard $NP$ -complete problems and Reduction techniques. Advanced Topics: Approximation algorithms, Randomized algorithms, Class of problems beyond $NP$ – $PSPACE$ .	<b>International Academia:</b> (MIT Open Courseware): Linear Programming: $LP$ , Reductions, Simplex, Complexity: $P$ , $NP$ , $NP$ -completeness, Reductions, Randomization: Skip Lists, Universal & Perfect Hashing, Amortization: Amortized Analysis, Incremental Improvement: Matching, Cryptography: Hash Functions, Encryption <a href="https://ocw.mit.edu/courses/6-046j-design-and-analysis-of-algorithms-spring-2015/pages/lecture-notes/">https://ocw.mit.edu/courses/6-046j-design-and-analysis-of-algorithms-spring-2015/pages/lecture-notes/</a>  <b>AICTE-prescribed syllabus:</b> <a href="https://www.aicte-india.org/sites/default/files/Mod">https://www.aicte-india.org/sites/default/files/Mod</a>	6	1. KMP String Matching: Given a text $txt[0..n-1]$ and a pattern $pat[0..m-1]$ , write a function $search(char\ pat[], char\ txt[])$ that prints all occurrences of $pat[]$ in $txt[]$ . You may assume that $n > m$ .  Text: A A B A A C A A D A A B A A B A  Pattern: A A B A  2. Implement a routine management system that will work for the next semester.
